500HT WAREWASHER PREPARATION

The 500HT Warewasher must be installed on a level, rigid surface. Use the front leveling feet to ensure that the machine is level from front to back. Allowance is to be made for water and drain lines to the unit. When situated, the machine must be completely sealed to the floor using a good grade of silicone sealant.

Area allowance - Width 24" (61.0 cm)
Height 34 5/8" (87.9 cm)
Depth 23 1/8" (58.7 cm)

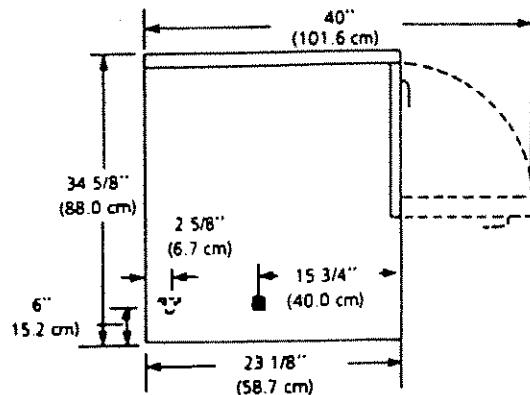

Remove the packing and dishware racks from the interior of the 500HT warewasher.

WATER

Install a shut off valve between the supply and the warewasher in an accessible location. Connect the 500HT Warewasher to the hot water supply. The incoming water temperature to the 500HT is to be 140 F (60 C) minimum and 160 F (71.1 C) maximum. Flow rate is 3.3 Imp gal., 4 US gal (15.1 L) per minute.

Flow Pressure - Minimum 20 psi
- Maximum 90 psi

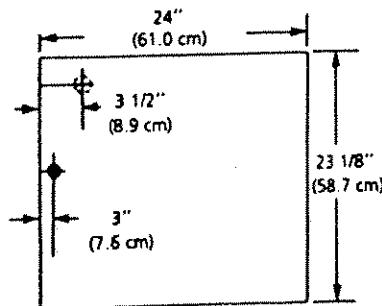

SIDE PLAN VIEW

DRAIN

Connect to 1 1/2" (3.82 cm) tailpiece per local plumbing code. Removable access covers is located on left side of the 500HT for drain and water line connection. Drain piping must be installed lower than the drain tailpiece and properly sloped to provide gravity drainage.

TOP PLAN VIEW

500HT WAREWASHER
ELECTRICAL

CAUTION: Plumbing connections must be made before power is connected to the machine. Damage to the booster heater elements will result otherwise.

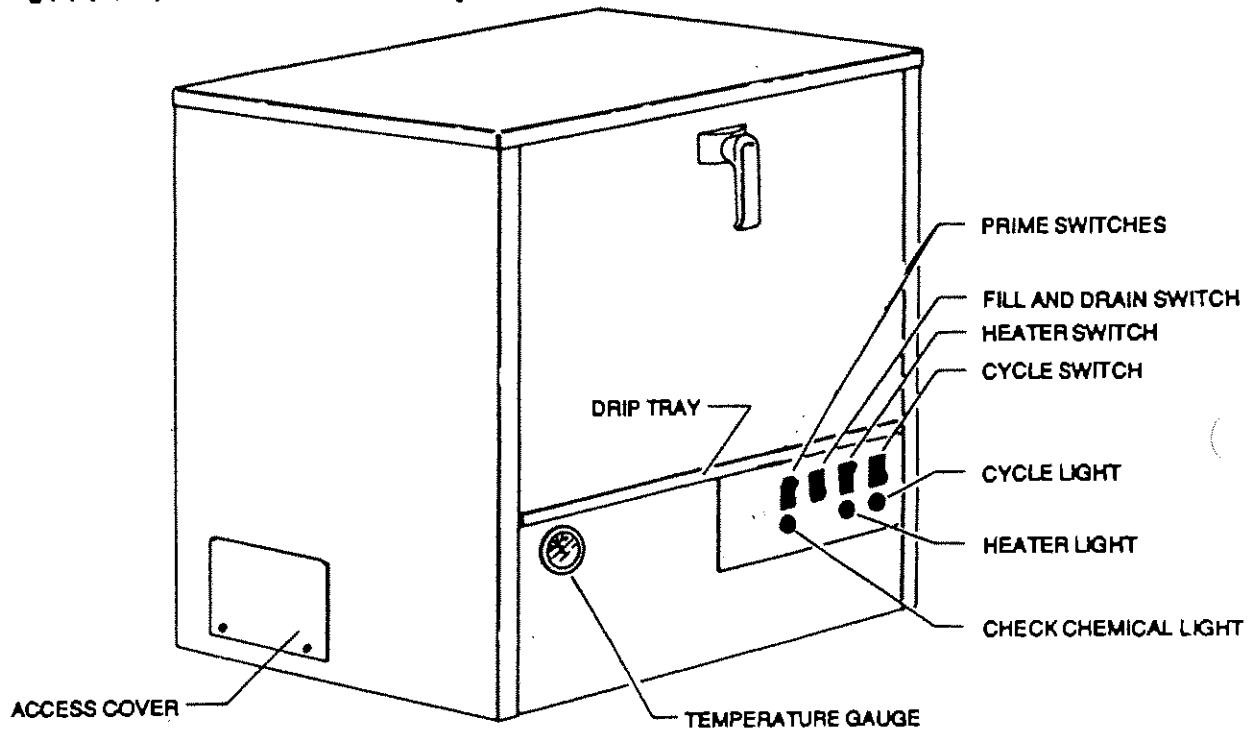

MAKE SURE THE HEATER SWITCH IS IN THE "OFF" POSITION. Damage to the booster heater elements will result otherwise. CONNECT ELECTRICAL POWER. 120/240 volt AC 4-wire 8 AWG line fused at 50 amps. Use wire rated for minimum 190°F/88°C service. PUSH FILL SWITCH TO FILL POSITION AND HOLD UNTIL THE BOOSTER TANK IS FULL.

Electrical connections should be made by a qualified electrician in accordance with local electrical codes.

OPERATING INSTRUCTIONS

1. Heater switch is "OFF"; cycle switch is "OFF".
2. Remove all packing material and dishracks from the interior of the warewasher.
3. Ensure screen assemblies are in their proper locations.
4. Place detergent (if equipped with optional liquid detergent feeder) and/or rinse feed lines in their respective product containers.
5. With the door open, turn on the power at the electrical panel or main disconnect box.
6. With the door open, prime each chemical until the fluid is seen dripping from the fill hole inside the machine (left side of wash compartment, above scrap screens).
7. Check "Chemical/Temperature" light; it should go out when booster tank reaches full operating temperature of 180°F/82.2°C and when optional detergent feeder is fully primed.
8. With the door open, press and hold the "FILL" switch until the water level covers the scrap screen assemblies in the wash area (see page 8).
9. Turn on the "HEATER" switch.
10. Turn on the "CYCLE" switch.
11. Pre-scrap or pre-flush all heavy soils from the dishes before loading them into the machine.
12. If not equipped with optional detergent feeder, add approximately one (1) Tablespoon powdered detergent into machine.
13. Load the pre-scraped dishware.

14. Closing the door will start the cycle, which is timed and automatic. There is a slight delay before the wash motor starts.
15. The amber cycle light will indicate that the warewasher is in cycle.
16. When the cycle light is "OFF", the cycle has been completed.
17. Open the door, and remove the clean dishware.
18. The door handle must be left in open position for 3 seconds to allow the automatic cycle to reset.

Note: After the initial fill, all following cycles are automatic, just load, close the door and place door handle in locked position to start cycle.

DRAINING THE MACHINE

1. Turn the "Start" switch to "Off".
2. Turn the "Heater" switch to "OFF".
3. Close the door.
4. Push the drain switch and hold until all of the water has been drained. This should take about 20 to 25 seconds.

500 HT

OPERATING AUTOMATIC DISHWASHERS

NOTE:

In order to provide consistant high quality dish washing this commercial dishwasher must be operated as follows:

TO START EACH DAY

1. Ensure that there is adequate supply of rince aid. (Jug in cupboard).
2. Heater switch and cycle/off switch will be in the off position.
3. With the door open, press and hold the fill switch until the water covers scrap screens.
4. Turn on the heater and cycle switches. Allow 15 minutes for dishwasher to come up to operating temperature. Temperature gauge should read between 140 - 150 degrees farenheit.
5. Cups should be loaded in the green peg rack only. Yellow rack is for cutlery.
6. Close the door and bring handle down into the verticle position. This will start the fully automatic timed cycle which will take 2 minutes 20 seconds.
7. When the right hand amber light goes off, the cycle is completed.
8. Open the door and remove the dishes.

NOTE:

After the initial fill, all following cycles are automatic. Leave heater and cycle switches on throughout the day. Just load, close the door and place door handle in verticle position to start following cycles.

AT THE END OF EACH DAY

1. Place the cycle/off switch in the off position.
2. Close and latch door.
3. Push and hold the drain switch to fully drain the machine. (This should take about 25 seconds).
4. Place the heater switch in the off position. (Must be in the off position overnight.)
5. Leave door fully open over night. (To air dry cavity) Do not close door with latch in verticle position

NOTE:

Occassionally check drip tray (under door) and empty as required.

NOTE:

Rinse aid dispensing is fully automatic however, when replacing a jug, insert dip tub in jug, press and hold the appropriate prime switch for approximately 25 seconds.

SAFETY FEATURES

The warewasher will not operate with the door open. Close the door and turn the handle down until it reaches the stop position.

500T/HT DAILY MAINTENANCE

Scheduled preventive maintenance practices will greatly increase the efficiency of your machine. A machine that is well maintained will not break down as frequently as one which receives only occasional care. A small investment of a few minutes each day will pay you dividends in the form of many trouble free hours of faithful service.

The best maintenance you can give your dishwashing machine is to keep it clean. By periodically cleaning and flushing the machine, you can add greatly to its life expectancy. The components of a machine that suffers from neglect will soon clog up and become inoperative.

CLEANING INSTRUCTIONS

1. Turn cycle switch off
2. Turn heater switch off
3. Press and hold drain button, **MAKE SURE DOOR IS CLOSED**, and the handle is in locked position. Hold drain button until wash well is empty (Approximately 20 to 25 seconds).
4. Release drain button, open door, remove wash arms, LH-RH scrap screen assy., and screen support assembly.
5. Empty and clean scrap screens, and screen support assembly. Failure to keep screens clean will result in poor wash results and could prevent proper draining during cycle.
6. Wash down the interior of the unit with a mild soap solution, flush and drain, then wipe down with a clean cloth.
7. Replace the screen support assembly, the scrap screens and the washarms. Do this in the order listed.
8. Close door, remove drip tray, clean and replace.
9. At the end of the work day, after completing steps 1 to 8 leave door partially open to allow the machine wash tank to air dry overnight.

NOTE: THE WASH TANK SHOULD BE LEFT EMPTIED OVER NIGHT.

DESCALING

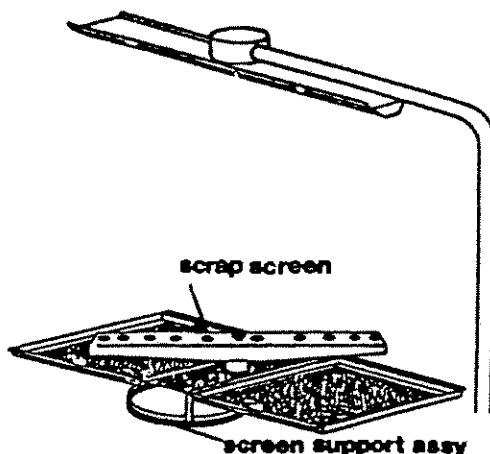

Descaling the warewasher interior may be necessary in areas with hard water. General descaling can be done by spraying a descaling chemical directly onto the scaled surface until the scale is removed, then flush with fresh water.

To descale the interior wash well, fill the wash well with fresh hot water to the normal water level or higher. Pour in the amount of descaler recommended by your chemical supplier (usual amount is 1 to 2 cups), and allow it to sit for no longer than half an hour. Drain, and flush with fresh hot water and drain again.

NOTE: Descaling chemicals are to be used with caution. Consult your chemical supplier for the proper use and handling instructions.

IMPORTANT

Do not operate the warewasher with the screen assemblies covered with food particles. Keep the screens clean. Pre-scraping or pre-flushing of dishware to remove heavy, loose particles of food is recommended. Failure to keep screens clean will result in poor wash results and could prevent proper draining during cycle.

CHEMICAL INJECTORS

The built-in Chemical Injectors will provide accurate dispensing and reliable operation. (Detergent feeder optional).

It is recommended that fresh hot tap water be flushed through the chemical feed tubes once a week to prevent a chemical coating from forming inside the tubing.

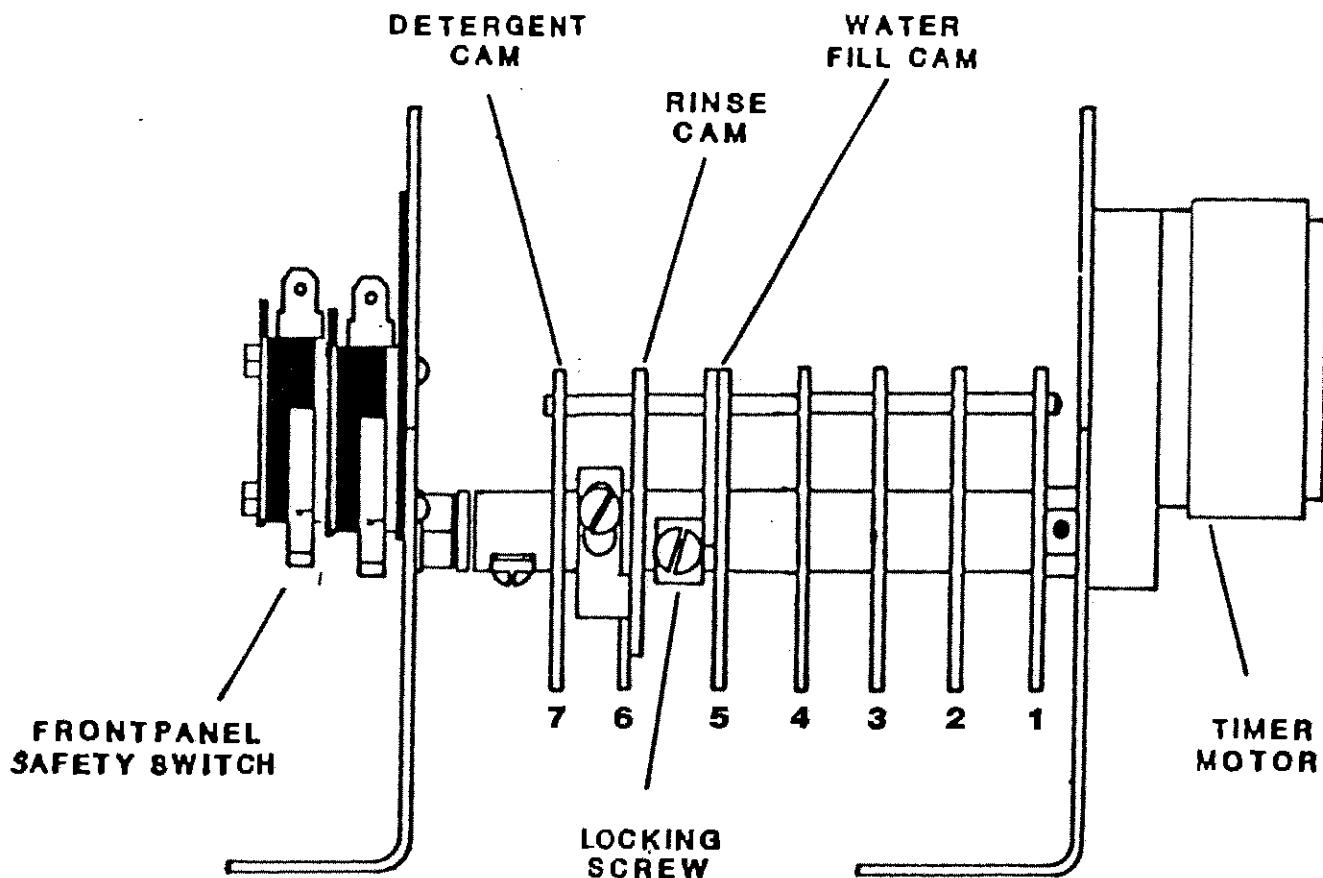

This is done by placing the tubes in a container of hot water and holding the respective prime switch until the chemical lines have been thoroughly flushed.

Visually inspect the hoses for possible leaks. If the hoses are in need of repair, contact your authorized service agent. Return the chemical feed lines to their proper chemical container and reprime them with chemical as described in step 6, on page 4.

500HT WAREWASHER CHEMICAL SETTINGS

To adjust the chemical concentration, do the following:

1. Remove the drip tray.
2. Remove the top left hand screw from the control box to allow the front panel to hinge forward.
3. Rotate the cam st by pushing the top of the cams towards the back of the warewasher until the locking screws onthe adjustable cams are accessible.
4. Loosen the screw for the chemical to be adjusted and increase or decrease the gap as desired.
5. Tighten the locking screw.
6. Replace the front panel mounting screw and the drip tray.
7. Operate the machine.

500HT
TROUBLE SHOOTING

1. WAREWASHER WILL NOT OPERATE

CAUSE

1. Power cord not plugged into power outlet
2. No power.
3. Door not closed.
4. Door switch out of adjustment or defective.
5. Cycle not resetting.

REMEDY

1. Plug into outlet.
- 2a. Check main "POWER" switch is in "ON" position.
b. Check electrical panel for blown fuse or tripped circuit breaker.
3. Ensure door is closed and door handle is turned down until it reaches stop position. Check door locking cam is properly positioned and secured to door handle shaft.
4. Reposition switch or replace handle.
- 5a. Unlatch door handle for full seconds to allow cycle timer to reset.
b. Replace homing cam switch.
c. Loose set screw on cam assy. - tighten screw
d. Defective door switch - replace
e. Defective cycle switch - replace

2. WASH WELL UNDERFILLS

CAUSE

1. Fill cam #5 on timer control shift out of adjustment.
2. Insufficient water pressure
3. Defective solenoid coil.
4. Filter screen in the solenoid plugged.

REMEDY

1. Reset fill cam to provide proper time to fill to screen level.
2. Check water line pressure. Ensure recommended flow rate and pressure is provided.
3. Replace the coil.
4. Clean the screen.

5. Defective water switch on timer.
6. Drain solenoid valve leaking.

3. WASH WELL OVERFILLS

CAUSE

1. Screen assemblies covered with foreign matter preventing complete removal of wash water during drain cycle.
2. Fill cam #5 on timer out of adjustment.
3. Pump plugged with foreign matter.
4. Drain solenoid blocked or not opening.
5. Main drain piping blocked.

4. WASH WELL DOES NOT DRAIN PROPERLY

CAUSE

1. Manual drain switch or pump motor cam switch in control panel faulty.
2. Pump plugged with foreign matter.
3. Defective pump impeller.
4. Defective pump motor.
5. Screen assemblies covered with foreign matter preventing wash water return to pump.
6. Main drain plugged.

5. Replace the switch.

6. Clean debris from valve seat or replace drain solenoid.

REMEDY

1. Keep screen assemblies clean at all times.
2. Reset fill cam to provide proper time to fill to screen assemblies.
- 3a. Clean out wash well and pump.
b. Clean pump intake screen.
4. Clean obstruction or replace drain solenoid.
5. Have piping unplugged.

REMEDY

1. Replace the defective switch.
2. Remove foreign matter from pump intake screen and/or pump assy.
3. Replace the impeller.
4. Replace the motor.
5. Keep screen assemblies clean at all times.
6. Clear obstruction from drain.

7. Drain solenoid will not open.

7a. Solenoid coil defective - replace.
b. Solenoid power cord unplugged at rear of control box - replug.
c. Drain arm broken or disconnected - replace drain valve assembly.

8. Drain solenoid will not close.

8a. Drain mechanism jammed with soils - clean.
b. See 7c.

9. Drain hose blocked or kinked

9. Replace hose

5. WASH WELL CONTINUALLY FILLS WHEN UNIT IS NOT OPERATING

CAUSE

1. Dirt under seat of solenoid or worn seat.

REMEDY

1. Clear seat of obstruction, replace solenoid valve if necessary.

2. Manual fill switch defective

2. Replace manual fill switch.

**6. WASH WATER BELOW MINIMUM RECOMMENDED TEMPERATURE
(140 F - 60 C)**

CAUSE

1. Thermostat set too low.

REMEDY

1. Increase temperature by turning thermostat control clockwise.

2. Defective thermostat.

2. Replace the thermostat.

3. Defective heater.

3. Replace the heater.

4. Manual reset tripped on wash tank limit thermostat.

4. Push reset button on thermostat.

5. Water supply temperature from the hot water tank too low.

5a. Hot water tank too small - replace with properly sized tank.

b. Thermostat control on hot water tank set too low - adjust to correct setting.

c. Heater element in hot water tank defective - replace element.

7. CHEMICAL NOT FEEDING

CAUSE

1. No chemical in container.
2. Feed lines to and from chemical pump plugged.
3. Screen on feed line plugged.
4. Chemical feeder defective.
5. Defective injector pump.
6. Chemical feeder system system not plugged into electrical receptacle.
7. Tubing kinked or split.
8. Worn Rotor
9. Element tube split or loose hose clamps or ties.

REMEDY

1. Replace with full container.
2. Clear obstruction, flush lines with hot water.
3. Clean.
4. Repair or replace chemical feeder
5. Repair or replace the pump.
6. Plug in.

7. Unkink tubing or replace.
8. Replace rotor
9. Replace element tube

8. DISHES DO NOT WASH PROPERLY

CAUSE

1. Improper concentration or type of detergent being used in wash well.
2. Overloading of dishware in dishrack.
3. Insufficient water in wash well.
4. Wash arms not turning.

REMEDY

1. Check with a qualified product representative for proper concentration and type of product to be used for local water conditions. Wash well holds 7 qts. (8 L) of water when at screen assembly level.
2. Space dishware in dishrack allowing room for water to circulate through dishware.
- 3a. Re-adjust fill cam to bring level to screen assemblies.
b. Check line flow rate and pressure.
4. Remove obstruction such as cutlery or clean spray nozzles and sprayarm support.

- 5. Pump not operating.
- 6. Defective pump impeller.
- 7. Defective pump motor.
- 8. Wash water temperature too low.
 - 8a. Must be not less than 140 F (60 C) and not higher than 160 F (71.1 C) for best wash results.
 - b. Check wash tank heater is switched "ON" and thermostat is properly set.
 - c. Wash tank thermostat is defective - replace.
 - d. Booster not providing 180 F water. Check booster. See Section 9.

If capacity insufficient, install the correct size hot water tank.
- 9. Worn sprayarm locator.
- 10. Pump intake or scrap screens blocked.
- 11. Lime scale build up
- 12. Rinse water below 180 F. minimum required temperature.
 - 12a. Heater elements defective - replace
 - b. Thermostat improperly set - adjust.
 - c. Thermostat defective - replace
 - d. High temperature cut-off thermostat defective - replace
 - e. No power to booster - check circuit breaker OR check for loose connection OR check for broken wire.
- 13. Warning light/buzzer activating.
 - 13a. Booster temperature too low - check Troubleshooting #8-12.
 - b. Temperature sensor defective - replace.
 - c. Optional detergent feeder system problem - check Troubleshooting #7-1 to 7.
